

header

main application header

main application toolbar

75u

240u

the arrow is visible only when the view is nested, main views don't have back arrows to go to home

tabbed view header

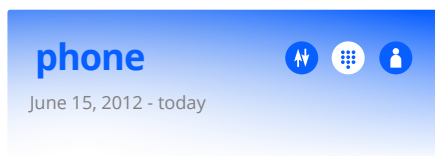

views slide in with parallax with the header so that when the title reaches the center of the header, the view is also centered in the screen.

If the view has large canvas, switching views can be done by swiping on the header or clicking the desired tab.

tabs should have an icon property, for compatibility with the Breeze theme, even if it's not visible here.

the tabbed view in breeze theme

If the toolbar icons are more than 3 or the app requires a menu, 3 dots signal that the header can be dragged down to reveal a menu

The dots are smaller than comfortable to tap, if tapped the menu should open anyway, but for easier operation, the user can just swipe down anywhere on the header, even if it's over a button
